Exp No: 15 Analyse Various Types of Servers Using Webalizer Tool

AIM:

To analyse web-server access logs using the Webalizer tool and study traffic statistics such as hits, files, pages, visits, data transferred and requested URLs.

ALGORITHM / PROCEDURE:

1. Open a Linux terminal on a lab system where Apache and Webalizer are installed or can be installed.

2. Generate or locate an authorised Apache access log, commonly /var/log/apache2/access.log.

3. Install Webalizer if it is not available by using the package manager.

4. Run Webalizer with the access-log path and, if required, specify an output directory for the HTML report.

5. Open the generated index.html report in a web browser.

6. Observe the summary, monthly history, daily usage, requested URLs, response codes and client statistics.

7. Record the values shown by your own log. Do not share reports containing sensitive client information.

COMMANDS USED:

```
sudo apt update
sudo apt install apache2 webalizer
sudo systemctl start apache2
sudo webalizer /var/log/apache2/access.log

# Optional: choose an output directory
sudo mkdir -p /var/www/html/webalizer
sudo webalizer -o /var/www/html/webalizer /var/log/apache2/access.log

# Open the generated report
http://localhost/webalizer/
```

DIAGRAM:

Fig 1: Workflow of Webalizer log analysis

PROGRAM / CONFIGURATION:

```
sudo webalizer -o /var/www/html/webalizer /var/log/apache2/access.log

The command reads the Apache access log and generates HTML statistics in the selected output directory. If the log p
```

OUTPUT:

```
Terminal - Webalizer report generation
$ sudo webalizer -o /var/www/html/webalizer /var/log/apache2/access.log
Generating report for access.log
Saving history information...
Generating report in /var/www/html/webalizer

Browser report (illustrative layout; actual values depend on your log):
Summary: Hits | Files | Pages | Visits | KBytes
Monthly Usage: graph of hits and visits
Top URLs: requested pages and request counts
Response Codes: 200 OK, 301 Redirect, 404 Not Found
```

RESULT:

Thus, Webalizer was used to process a web-server access log and generate an HTML report for analysing server usage and traffic statistics.
